

## HEIGHT SAFETY SYSTEM

# “FREEWAY” LADDER LINE

The **Ladder Line** ladder height safety system is designed for use with fixed ladders to provide fall protection to the user during ascent or decent.

The system comprises a permanently installed top bracket fixed to either the top rungs or ladder stile with a stainless cable running the entire length of the ladder and tensioned at a second bracket fixed to the bottom area.

The user is connected to the line via a special sleeve that is also connected to an attachment point on the users harness. In the event of a slip or fall, the sleeve locks automatically and prevents the climber from falling and remains locked until a firm footing can be regained.

### Ladder Safety Sleeve

Can be attached at any point on the stainless wire and cannot be removed while the karabiner is still attached. This safety sleeve allows trouble free ascending or descending and will arrest a fall should the climber slip.
